

1 cylinder

2 strokes		4 strokes	
pickup on crankshaft <i>There is no camshaft on a 2 strokes.</i>	pickup on crankshaft	pickup on crankshaft	pickup on camshaft
<p>Each time the piston reaches TDC (Top Dead Center) of the cylinder, there is a spark.</p>	<p>Each time the piston reach TDC, there is a spark. So a useful spark happens at compression stroke and another wasted spark appends during exhaust stroke.</p>	<p>There is no wasted spark.</p> <p>There is a spark only when piston reaches TDC of the cylinder during compression stroke.</p>	<p>There is no wasted spark.</p> <p>There is a spark only when piston reaches TDC of the cylinder during compression stroke.</p>
			
<p>CDI compatibility Yes</p>	<p>CDI compatibility Yes</p>	<p>CDI compatibility No</p> <p><i>as there are 1 pickup signal every 2 rotations, CDI believes that the engine is running at 5000 when it run at 10000rpm</i></p>	

2 cylinders

Opposed pistons. Pistons are moving in the <u>opposite</u> direction. <i>(one goes up while the other goes down)</i>		Synchronous pistons. Pistons are moving in the <u>same</u> direction. <i>(both go up and down at the same time)</i>	
180° crankshaft		360° crankshaft	
Most Japanese Straight-twin		Old British Straight-twin Some V-Twin engines	
pickup on crankshaft		pickup on crankshaft	
2 strokes	4 strokes	2 strokes	4 strokes
<p>Each time one of the pistons comes to TDC, there is a spark.</p> <p>So a useful spark happens at compression for cyl1 and at the same time on exhaust for cyl2.</p> <p>There must be 1 trigger point per crankshaft rotation.</p>	<p>Each time one of the pistons comes to TDC, there is a spark.</p> <p>So a useful spark happens at compression stroke and another wasted spark appends during exhaust stroke.</p> <p>There must be 2 trigger points per crankshaft rotation. <i>(1 for each piston)</i></p>	<p>Each time the 2 pistons come to TDC, there is a spark.</p> <p>There must be 1 trigger point per crankshaft rotation.</p>	<p>Each time 2 pistons come to TDC, there is a spark.</p> <p>So a useful spark happens at compression stroke and another wasted spark appends during exhaust stroke.</p> <p>There must be 1 trigger point per crankshaft rotation.</p>
<p>CDI compatibility Analog CDI: Yes Wasted spark</p>	<p>CDI compatibility No <i>spark occurs at wrong time</i></p>	<p>CDI compatibility Yes</p>	
<p>Digital CDI: No <i>5000rpm will be seen as 10000rpm</i></p>
